INTRODUCTION

This guide will show you how to remove the wireless card in a few easy steps.

🔧 TOOLS:

- Spudger (1)
- Phillips #1 Screwdriver (1)
- iFixit Opening Tools (2)

At least one wide plastic opening tool.

Step 1 — Back Panel

- Remove the grey scuff guard at the bottom of the PC by pressing down on it, and pulling it away.

- Lift the hinge and remove the grey rubber tabs on either side of the PC's model information.

- Remove the two 7.62mm Phillips #1 screws beneath the rubber tabs under the hinge and the four 7.62mm Phillips #1 screws where the scuff guard was removed.

- Remove the two 4.74mm Phillips #1 screws under the hinge (near the hinge joints) and a 4.74mm Phillips #1 screw under the handle.
Step 2

- Use 1-2 plastic opening tools or nylon spudgers to firmly pry open the back panel.

- (i) We recommend that you start prying the panel where the scuff guard was removed.

- (i) Prying the back panel will cause loud popping noises. This is just the sound of the clips that hold the back panel to the PC popping off.

- ⚠ Using excess force while prying can break the clips that hold the back panel and can damage the ports on the side of the PC.

Step 3

- Disconnect the three cables connecting the back panel ports to the motherboard.

- Flip up the locking latch holding the two ribbon cables with a plastic opening tool and pull the cables out.

- Gently wiggle the third connector out of its socket.
Step 4 — Wireless Card

- The wireless card is on the corner of the motherboard next to the speaker. Remove the black tape to reveal the wireless card.

Step 5

- Remove the 3.5 mm Phillips #1 screw from the wireless card.

- Remove the connectors by pulling straight up on their ends.

Step 6

- Remove the wireless card from the casing by lifting up then pulling out.

⚠️ The wireless card is fragile. Be careful when pulling it out of the casing.

To reassemble your device, follow these instructions in reverse order.
