## TOOLS:

[Essential Electronics Toolkit](#) (1)  
[Spudger](#) (1)  
[iOpener](#) (1)  
[SIM Card Eject Tool](#) (1)  
[Standoff Screwdriver for iPhones](#) (1)  
[Precision Utility Knife](#) (1)  
[iSlack](#) (1)

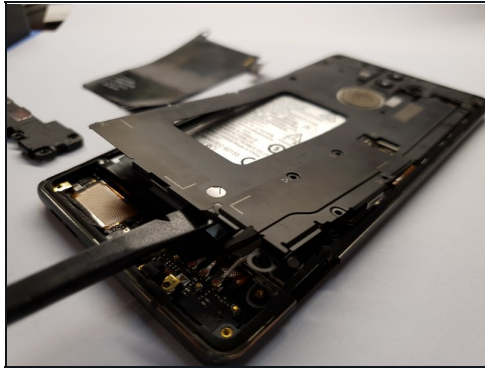

---

### Step 1 — Back glass removal

- Start by heating up the back glass. iFixit's iOpener kit is very useful here. You can also use heating pad or heat gun
- Take off the SIM tray, and start there. Use suction cup if available
- After you have made room for [plastic card](#), finish the work by going around the glass with card

## Step 2 — Midframe

- Start by screwing off all screws. There are 3 type of different screws.
  - 11 pcs of longer black painted screws
  - 10 pcs of shorter black painted screws
  - 1 shiny metallic screw
- After that, pop off bottom piece and then midframe

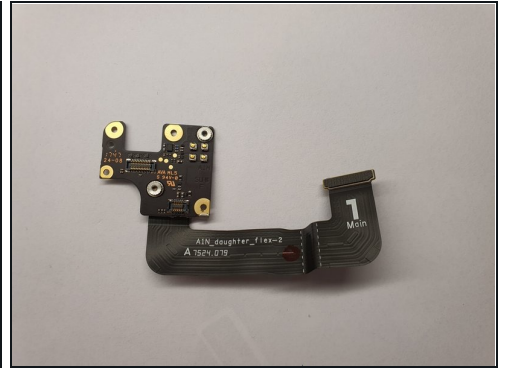

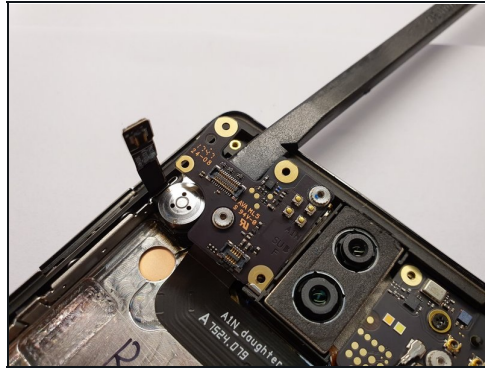

## Step 3 — Battery

- Remember to disconnect battery connector first
- Battery has pull tabs, so you should try this first
- If pull tab breaks, you have to commit a *pry of shame*

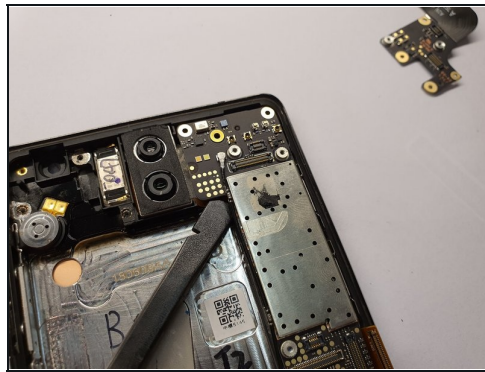

## Step 4 — Daughter board

- Disconnect volume and power button connector
- Disconnect connector on motherboard
- Pry off the daughter board

## Step 5 — Motherboard

- There are 2 screws
  - 1 longer black screw
  - 1 standoff screw
- After taking the screws off, you can disconnect antenna coaxial cables
- Now you can take motherboard off
- Make sure to push SIM-eject pin out first

## Step 6 — Charging board

- Charging board is held down with 2 screws
    - 1 black screw
    - 1 golden screw
  - After taking the screws off, charging board is free
  - And now you are done, repeat steps backward to put everything back together
-
