INTRODUCTION

The PCG F360 comes with 64 MB of on-board RAM. An additional 128 MB can be added on for a total of 192 MB.

⚒ TOOLS:

- Phillips #00 Screwdriver (1)
- Spudger (1)

Step 1 — Battery

- Position the laptop screen-side down as shown.

- In this position the battery housing will be located on the right hand side.

Step 2

- Lift the panel up and then out to gain access to the battery.

This document was generated on 2020-11-28 01:49:35 AM (MST).

Step 3

● Use the indentations to pull the old battery out.

Step 4

● The battery is now removed and it is safe to move on to uninstalling other components.

Step 5 — Keyboard

- There are two screws on the left hand side of the laptop near the IR (Infared remote) receiver (see image). Remove them using a Phillips #00 Screwdriver.

- Slide the speaker panel towards the left, then carefully flip it over onto the keyboard.

⚠ Make sure not to pull the speaker panel away from the computer just yet - it is still connected!

Step 6

- On the inside of the speaker panel, using a spudger, push the beige tab in the direction of the ribbon. It should only move a small amount.

- Remove the ribbon by gently pulling on it, there should be little or no resistance.

- Now the speaker panel can be set aside.

Step 7

- Remove the metal screw that will be located at the red circle.

- Pull on the green strip, and the keyboard should come free easily.

Step 8 — RAM

- Slide your RAM into the housing by aligning it with the plastic, tan colored, guides until it is firmly in place.

- ⓘ The computer in the picture only has the standard 64 MB of on-board RAM. This RAM is not removable from the motherboard, but additional RAM can be added.

To reassemble your device, follow these instructions in reverse order.
