### TOOLS:

- [Magnetic Project Mat](#) (1)
  - [Magnetic Phillips Screwdriver](#) (1)
  - [Precision tweezers](#) (1)
  - [Spudger](#) (1)
-

## Step 1 — Tripod Mount

- Position the back of the camera facing you and open the LCD screen to the left.

## Step 2

- Use a Phillips screwdriver to unscrew the two 5.556 mm screws under the LCD screen.

## Step 3

- Use a Phillips screwdriver and remove the eleven 5.556 mm screws around the outside frame of the camera.

## Step 4

- Open the "HDMI" rubber flap.
- Use a Phillips screwdriver and remove the 5.556 mm screw underneath the flap.

## Step 5

- ❗ The flash button is located on the left side of the built-in flash compartment.
- Press the flash button (as shown) to access flash.

## Step 6

- Use a spudger to wedge underneath the flash
  - Pry (up and down) to separate.
- ⚠ It is important to choose a tool that is ESD-safe to avoid accidental damage to the device. A black nylon spudger, or plastic opening tool, should be used whenever possible.

## Step 7

- Use your hands to gently pull the front and back of the camera apart.
- ⚠ Be careful not to damage the ribbon-wire shown in the red box.

## Step 8

- Use needle-nose tweezers to gently lift the black/grey latch towards the ribbon-wire (the latch rotates upward to release and snaps down to lock).
- ⚠ Be careful not to break the latch. It cannot be replaced.
- Use tweezers to gently remove ribbon-wires.
- Pull the ribbon-wires towards the back-end of the camera.

## Step 9

- Use a Phillips screwdriver and remove the single 6.350 mm screw, left of the mode-adjustment dial.

## Step 10

- Use needle-nose tweezers to remove the large ribbon-wire located under the screw.
  - Gently wiggle the ribbon out in an upward motion.
- i** For easier access, you can push the black surface of the camera where the buttons and dials are located. Do not push too hard as this may break the plastic.

## Step 11

- Insert a plastic opening tool under the shutter button.
- Gently pry (back and forth) between the rubber grip and camera casing.

## Step 12

- Place hands around the camera. Hold onto the mode dial and grip under the shutter button.
- Gently push right thumb away and pull in left index finger to separate the camera halves.

## Step 13

- Use a Phillips screwdriver to remove the nine 3.175 mm screws on the inside of the camera.
- Use tweezers to remove the golden bracket.

## Step 14

- Use tweezers to remove the white film under the shutter-release button.
- i* This white film is a cover for the electrical components. The camera will not be affected if it rips or comes off completely.
- ⚠** Be careful: three high-discharge capacitor leads are located under this film, and can result in electric shock if touched.

## Step 15

- Use tweezers to remove the yellow ribbon-wire.
- Gently wiggle it to the left and then out of its port.

## Step 16

- Use hands to remove the metal cover.
- Pull the cover up.

## Step 17

- Use tweezers to remove the golden bracket.

## Step 18

**i** The tripod connector is located at the bottom of the camera.

- Use tweezers to remove the tripod connector.

## Step 19 — Lens

- Unscrew the three 3.175mm screws.

⚠ Use caution to not to lose the screws in the cavities of the camera.

## Step 20

- Continue removing screws, keeping an awareness of the cavity right below the screw. It would be difficult to extract screw if lost in this cavity.

## Step 21

- Remove lens by pulling up vertically.
- Be careful not to damage any of the electrical ribbon on top of the lens.

To reassemble your device, follow these instructions in reverse order.
