INTRODUCTION

A dysfunctional hard drive can completely ruin the life of an otherwise functional computer; therefore, if any problems arise regarding the hard drive, it should be fixed or replaced. Removing the hard drive requires the battery and back cover to be removed and then only a few screws need to be removed to completely take out the hard drive.

TOOLS:

- [Phillips #0 Screwdriver](#) (1)
 - [Flathead 3/32" or 2.5 mm Screwdriver](#) (1)
-

Step 1 — Battery

- Orient the ACER Aspire One to where the bottom of the laptop is facing upward as shown in the picture.

Step 2

- Locate the circular slot positioned at the bottom right of the battery.

Step 3

- Insert a spudger and slide the tab to the right.

 When working with electronics, it's important to choose a tool that's ESD-safe to avoid accidental damage to the device. The regular black nylon spudger or a plastic opening tool should be used whenever possible.

- Hold the tab in the right-hand position and firmly push or pull the battery upward to remove it from the laptop.

Step 4 — Back Cover

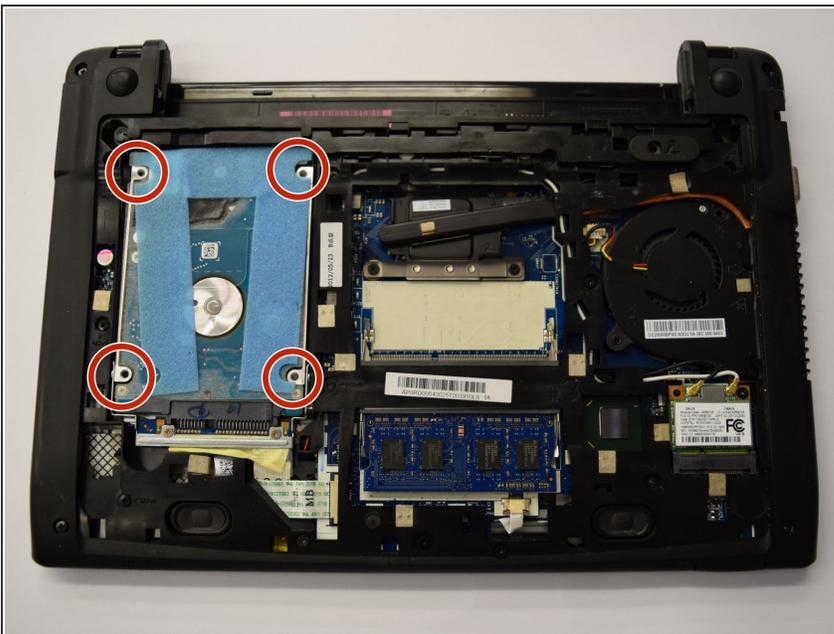

- Locate the single 6 mm Phillips screw in the lower middle of the back plate.
- Remove the screw using a Phillips #0 Screwdriver.

Step 5

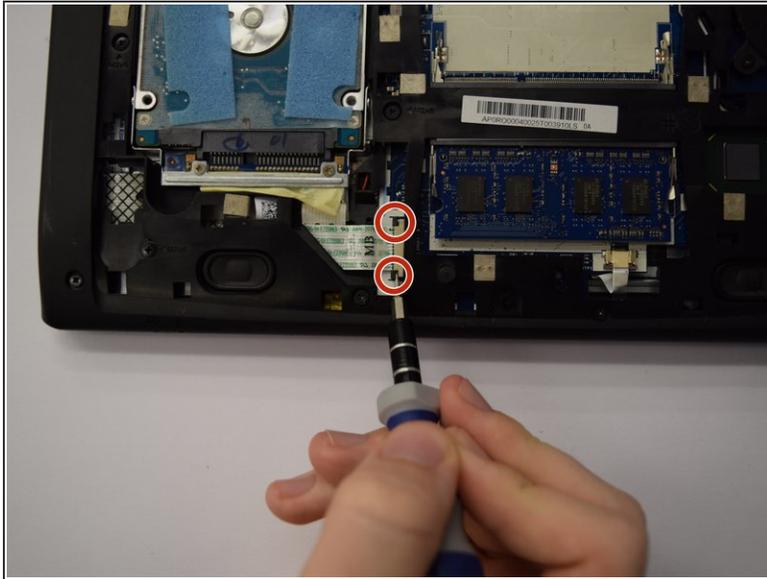

- Slide the back plate downward to remove it from the laptop.

Step 6 — Hard Drive

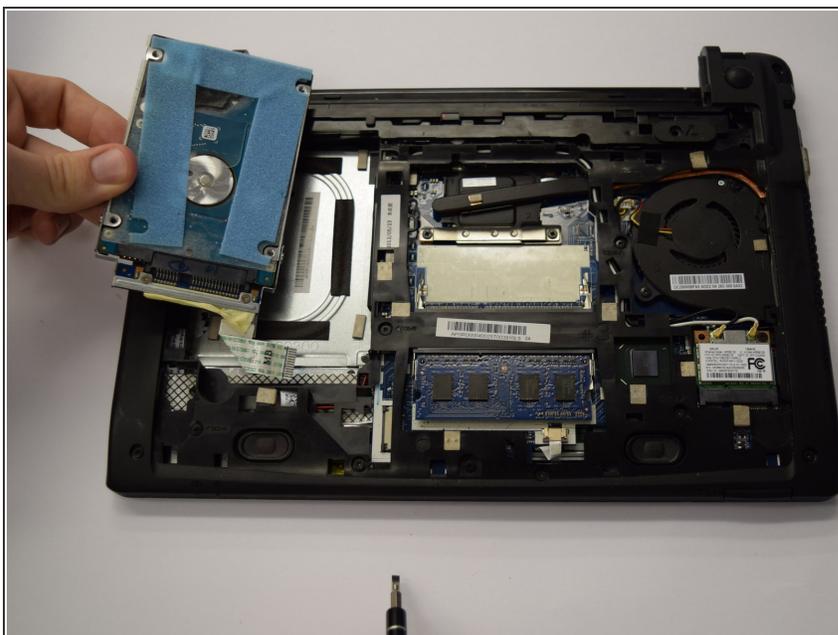

- Locate the four 6 mm Phillips screws pictured necessary to remove the hard drive.
- Remove all four of the screws using a Phillips #0 Screwdriver.

Step 7

- Locate the two tabs that keep the hard drive ribbon cable connected to the laptop.
- Using a spudger, gently push in the indicated tabs.
- While holding down the tabs, slide the ribbon cable to the left to remove it from the laptop.

Step 8

- Remove the hard drive by pulling it straight out.

To reassemble your device, follow these instructions in reverse order.
